

<p>1. <b>A)</b> - Although Euclid (c. 300 BC) preceded Apollonius (c 262-200 BC), Apollonius is considered the father of analytic geometry for his extensive works in conics among other topics.</p>	<p>6. <b>A)</b> - For a parabola with vertex at the origin and focus lying on the <math>y</math>-axis at <math>(p,0)</math>, the equation for the parabola can be written as <math>y^2 = 4px</math>.</p>	<p>11. <b>B)</b> - Each of the fifth roots of <math>-2</math> lie on a circle around the origin with radius <math>r = \sqrt[5]{2}</math>, where the absolute value of each point on the circle is <math>\sqrt[5]{2}</math>. Therefore, the sum of 5 fifth roots is <math>5\sqrt[5]{2}</math>.</p>
<p>2. <b>B)</b> - The eccentricity of all parabolas is 1.</p>	<p>7. <b>A)</b></p> 	<p>12. <b>A)</b> - The length of the <math>lr = \frac{2b^2}{a}</math>. The distance between the latera recta <math>d = 2c = 2\sqrt{a^2 - b^2}</math>. <math>A = lr \cdot 2c = \frac{8}{3} \cdot 2\sqrt{5}</math></p>
<p>3. <b>A)</b> - For a plane with equation <math>Ax + By + Cz + D = 0</math> and point <math>(x_1, y_1, z_1)</math>, the distance from plane to point is given by <math>d = \frac{Ax_1 + By_1 + Cz_1 + D}{\sqrt{A^2 + B^2 + C^2}}</math></p>	<p>8. <b>B)</b></p> $A_{\text{ellipse}} = \pi ab$ $A_{\text{circle}} = \pi a^2$ $\frac{A_{\text{ellipse}}}{A_{\text{circle}}} = \frac{b}{a}$	<p>13. <b>D)</b> - centers: circle 1: (1,1) circle 2: (-3,-2) <math>d = \sqrt{(1+3)^2 + (1+2)^2} = 5</math></p>
<p>4. <b>C)</b> - For an ellipse with foci lying on the <math>y</math>-axis (<math>\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1</math>), the eccentricity is defined as <math>e = \frac{c}{a} = \frac{\sqrt{a^2 - b^2}}{a}</math></p>	<p>9. <b>D)</b> - the counterclockwise angle, <math>\theta = 90 - \arctan m</math> is found where <math>m</math> is the positive root of <math>hm^2 + (a-b)m - h = 0</math> from the equation: <math>ax^2 + 2hxy + by^2 + \dots = 0</math></p>	<p>14. <b>B)</b> sphere 1: <math>r = \sqrt{3}</math> cube 1: <math>s = 2</math> sphere 2: <math>r = 1</math> etc .... <math>\text{ratio}_{\text{radii}} = \frac{1}{\sqrt{3}}</math> <math>\sum \text{radii} = \frac{\sqrt{3}}{1 - 1/\sqrt{3}} = \frac{3}{\sqrt{3} - 1}</math></p>
<p>5. <b>E)</b> - For hyperbola with equation <math>\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1</math>, the asymptotes have slopes of <math>\pm \frac{b}{a}</math>. In this case, <math>\pm \frac{b}{a} = \pm \frac{3}{2}</math>.</p>	<p>10. <b>C)</b> <math>4 \sin \theta \cos \theta = 2 \sin(2\theta)</math> For <math>r = a \sin(b\theta)</math> where <math>b</math> is even, the number of petals, <math>p = 2b</math>.</p>	<p>15. <b>B)</b> <math>x = \frac{-b}{2a} = -3</math> <math>y = (-3)^2 + 6(-3) + 11 = 2</math></p>

<p>16. <b>A)</b> – The line must have a slope, <math>m = 1</math>. It is therefore tangent to the circle at the points <math>(-2,2)</math> and <math>(2,-2)</math>. The possible answers are <math>y = x \pm 4</math>.</p>	<p>21. <b>A)</b> - Take two vectors formed at the intersection of the two lines (a good pair are <math>a = \langle 2,3 \rangle</math> and <math>b = \langle 1,5 \rangle</math>)</p> <p>Now, <math>\cos \theta = \frac{a \cdot b}{\ a\  \ b\ } = 45^\circ</math></p>	<p>26. <b>C)</b> From the definition of a parabola.</p>																												
<p>17. <b>C)</b>  <math>\det = (\sin x + 1)(1 - \sin x \cos x)</math>  when <math>x = \frac{3\pi}{2}</math>, <math>\sin x = -1</math>  and <math>\det = 0</math></p>	<p>22. <b>D)</b> – the perpendicular vector can be found by computing the cross product <math>\langle 1,2,3 \rangle \times \langle 4,5,6 \rangle = \langle -3,6,-3 \rangle</math> so <math>\langle -1,2,-1 \rangle</math> will also be perpendicular.</p>	<p>27. <b>C)</b> – A parabola can be written in polar for as <math>r = \frac{2p}{1 \pm \cos \theta}</math> or <math>\frac{2p}{1 \pm \sin \theta}</math>, <math>p \neq 0</math>.</p>																												
<p>18. <b>E)</b></p> $r_{\text{circum}} = \frac{abc}{4 \cdot \text{Area}} = \frac{5}{2}$ $r_{\text{in}} = \frac{\text{Area}}{\text{semi-perimeter}} = 1$	<p>23. <b>B)</b> - The ratio of areas is equal to the determinant of the transform matrix, in this case 5. To see this, multiply each point like so:</p> $\begin{bmatrix} 1 & -2 \\ 3 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x' \\ y' \end{bmatrix}$ <p>and find the area of the triangle given by the resulting points.</p>	<p>28. <b>D)</b> – The area of the annulus between the two circles is given by <math>A = \pi(R^2 - r^2)</math>. From the triangle, <math>(R^2 - r^2) = 36</math>.</p> 																												
<p>19. <b>D)</b> "Green's Theorem" for polynomials...</p> $A = \frac{ 19 - (-25) }{2} = 22$ <table border="1" style="display: inline-table; vertical-align: middle;"> <tr><td>0</td><td>0</td><td>0</td><td>0</td></tr> <tr><td>2</td><td>2</td><td>0</td><td>0</td></tr> <tr><td>5</td><td>3</td><td>6</td><td>0</td></tr> <tr><td>4</td><td>-3</td><td>-15</td><td>0</td></tr> <tr><td>1</td><td>-4</td><td>-16</td><td>0</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>6</td></tr> <tr><td>19</td><td></td><td></td><td>-25</td></tr> </table>	0	0	0	0	2	2	0	0	5	3	6	0	4	-3	-15	0	1	-4	-16	0	0	0	0	6	19			-25	<p>24. <b>C)</b></p>  <p><math>A = bh</math>,  <math>b = 2 \cdot 3 \cdot \pi</math>, <math>h = 3</math>  <math>A = 18\pi</math></p>	<p>29. <b>B)</b> – The five platonic solids are a tetrahedron, cube, octahedron, dodecahedron, and icosahedron, having faces of 4, 6, 8, 12, and 20, respectively.</p>
0	0	0	0
